## Introduction

Iran is among the Southeast Asian countries (Middle East) which neighbors Afghanistan and Pakistan in the East, Turkmenistan in the Northeast, Azerbaijan and Armenia in the Northwest, and Turkey and Iraq in the West. With an area of more than 1648195 km<sup>2</sup> this country accommodates more than 75 million people. The geological characteristics and metallogenic suitable conditions of Iran have led to the discovery of 68 minerals and about 60 billion tons of absolute and probable reserves. These conditions along with the area of the land, relative abundance of energy resources and strategic position have provided the basis for advantages presented to investors active in this sector. The strategic position of Iran, its location (which is on the lifeline of Middle East, Asia, Central Asia, Europe, and Africa), and rapid access of foreign investors to Iranian markets and 15 neighboring countries (with a population of more than 500 million people) have set the scene for an increase in the investments in Iran. The volume of previous exploration activities is insignificant as compared to the mineral reserves of Iran. So far, exploration activities have been mainly focused on surface resources. However, using the geological sciences associated with mining and by developing and completing minerals discoveries at depth and surfaces it is possible to identify, discover and operate rich resources. The geological characteristics of Iran can lead to a considerable increase in the production of minerals such as copper, lead, zinc, iron, gold, rare earth elements, barite and other industrial ores, non-metallic substances, and decorative and surface stones. Such an increase is highly promising for investments in the discovery of mineral reserves.
